

Supplemental Figure S2: Variations in coral colonisation density

Plan views of model branching and massive coral reefs, showing the effects of decreasing the recruitment rate from 0.25% to 0.125% (**A** – branching reef, 100 iterations, and **B** – massive reef, 80 iterations), increasing the recruitment rate to 1% (**C** – branching reef, 90 iterations and **D** – massive reef, 60 iterations), and periodically adding new recruits during reef growth (**E** – branching reef, 100 iterations, and **F** – massive reef, 70 iterations).
